Future of Money

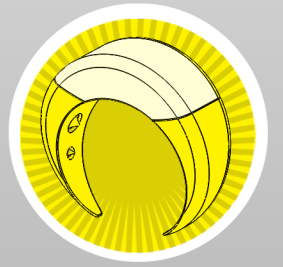

ever present awareness

1– Financial disturbance

2– Triggering

3– Increased Awareness

Gettin closer to the transition stage where our money will no longer be represented as physical entities but rather as electronic bits of information will bring a perceptual change in the way we acknowledge the existence of our finance.

This concept proposes a ring which would have embedded connectivity and a response system based on pain feedback (due to higher speed than any other tactile signal). User can choose what will trigger the device creating a more personalised approach tailored to each individual.

Wearing the ring will create a constant link to the online finances of the user and an instant response through a bite like experience produced by tiny spikes inside the ring actuated through shape memory nitinol wire. Having served its purpose the ring retracts to dormant state.

Design: Dimitrios Stamatis (Brunel University)
